Ivan Seleznov (iOne-5)

Most images are in good resolution and follow a consistent naming convention.

Although the majority are square, the resolutions vary considerably across the dataset. Therefore, the dataset is not standardized to a fixed image size
For example:
PAT_26_37_865 (992 x 992)
PAT_38_54_234 (1806 x 1806)
PAT_38_1003_68 (406 x 406)
PAT_40_56_160 (750 x 750)

The dataset contains both RGB and RGBA image formats, meaning that the number of channels is not consistent across all images. This is worth considering for training Machine Learning Models (because RGBA images have 4 channels, not 3)

Zoom should be considered while working with images (lesion may just seem bigger because of the zoom, not the size itself)

Some images appear slightly out of focus(at the lesion site) (e.g., PAT_247_1294_292), which may affect feature extraction or visual analysis.
